

Work agreed. Payment protected.

A milestone-based Web3 escrow platform that protects client payments and contributor work with smart contracts, IPFS evidence, dispute arbitration, and on-chain reputation.

● Live on Ethereum Sepolia

HACKBLOX 2026 — Web3 Track

`pact-ten-gamma.vercel.app`

— THE PROBLEM

Freelance work still depends on trust between strangers.

THE CLIENT WORRIES

"What if I pay upfront —
and the work never arrives?"

THE CONTRIBUTOR WORRIES

"What if I finish the work —
and the client refuses to pay?"

Centralized platforms **hold the money**
and the power.

Platform **fees** cut into every payment.

One disagreement can **freeze the entire
payment.**

— THE SOLUTION

Pact splits every job into milestones. Each one settles on its own.

IF THEY DISAGREE Dispute → predefined **Arbitrator** → release to contributor *or* refund to client

The client locks the full amount up front. The contract — not either person — holds it. **One disputed milestone never freezes the rest.**

A complete escrow product, not a mock-up.

Milestone escrow

Funds lock in a Solidity smart contract. Each milestone settles independently — neither party controls the money alone.

Dispute arbitration

A predefined arbitrator releases the disputed milestone — or refunds it. Their decision is recorded on-chain.

IPFS evidence

Agreements and deliverables pin to IPFS from the app. The ipfs:// CID is stored on-chain — tamper-resistant proof of what was submitted.

On-chain reputation

$\text{score} = \text{released milestones} + 5 \times \text{completed jobs}$

Computed from real settlements — no self-written ratings.

ETH + ERC-20

Native ETH escrow, plus the standard token flow — approve → transferFrom → transfer — with a valueless testnet mUSDC.

Wallet-native app

MetaMask-connected Next.js interface: create, fund, deliver, approve, dispute, arbitrate — every role in one place.

Architecture in one glance.

— LIVE & VERIFIED

Not a demo video. Real Sepolia transactions.

✓ LIVE ON SEPOLIA

✓ 20 / 20 TESTS PASS

✓ CONTRACTS SOURCE-VERIFIED

✓ IPFS UPLOAD WORKING

✓ FULL ETH LIFECYCLE ON-CHAIN

- Real agreement: funded → IPFS evidence → 2 releases → dispute → arbitrator refund

- Contract source verified — exact match (solc 0.8.28, cancun)

- Arbitrator refund transaction — public on the explorer

Honest scope: mUSDC token escrow is implemented and covered by the passing test suite; its full token lifecycle has not yet been presented as live Sepolia evidence.

Replace platform trust with contract enforcement.

Traditional freelance payment	PACT
× Trust the platform	✓ Trust the smart contract
× Full payment at risk	✓ Milestone-based risk
× Centralized records	✓ On-chain settlement
× Uploaded evidence	✓ IPFS-linked evidence
× Platform reputation	✓ On-chain work reputation
× A dispute can affect the entire payment	✓ Dispute isolated per milestone

"Instead of asking clients and contributors to trust each other, **Pact** makes the agreement enforceable through code."
